

Africa's capacity for Real-time Polymerase Chain Reaction (RT-PCR) diagnosis of infectious diseases

Live workshop

30 JUNE 2021

14:00-17:00 BST

The tools and strategies used to manage public health emergency operations in laboratories and centres during 'peace time' may need to be adjusted significantly in an emergency response situation. The capability to undertake such adjustments needs to be developed accordingly. This session will introduce and elaborate on some novel strategies to improve molecular diagnosis, including the co-primer technology and platform for real-time PCR diagnosis, as well as the suitcase lab for rapid detection and sequencing of SARS-CoV-2 in low resource settings
